

Lec 22. NP-completeness

Eunjung Kim

POLYNOMIAL-TIME MANY-ONE REDUCTION

Let $A \subseteq \{0, 1\}^*$ and $B \subseteq \{0, 1\}^*$ be two languages, i.e. two (decision) problems

P-TIME MANY-ONE REDUCTION

We say that A is **polynomial-time many-one reducible** to B , written as $A \leq_p B$, if there is a polynomial-time computable function $f : \{0, 1\}^* \rightarrow \{0, 1\}^*$ such that for every input $w \in \{0, 1\}^*$,

$$w \in A \text{ if and only if } f(w) \in B.$$

Also called polynomial-time mapping reduction, polynomial-time Karp reduction and polynomial-time transformation.

NP-HARD, NP-COMPLETE

DEFINITIONS

A language L is said to be **NP-hard** if $A \leq_p L$ for **every** language $A \in \text{NP}$.

A language L is said to be **NP-complete** if L is NP-hard **and** $L \in \text{NP}$.

$A \leq_p B$ MEANS B IS AS HARD AS A

TRANSITIVITY

If $A \leq_p B$ and $B \leq_p C$, then $A \leq_p C$.

NP-HARDNESS PROPAGATES FORWARDS

If $A \leq_p B$ and A is NP-hard, then B is NP-hard.

P-TIME FOR ONE NP-COMPLETE PROBLEM

Let L be NP-complete. Then $L \in P$ if and only if $P = NP$.

FIRST NP-COMPLETE PROBLEM

COOK-LEVIN THEOREM

SATISFIABILITY is NP-complete.

BOOLEAN SATISFIABILITY

- **Boolean Formula**: an expression formed from boolean variables using logical connectives \wedge ('AND'), \vee 's ('OR') and the negation \neg .
 $(x_1 \vee \bar{x}_3) \wedge (\neg(x_2 \wedge x_4) \vee ((\bar{x}_1 \vee x_2) \wedge \bar{x}_5)) \wedge (\neg(\bar{x}_1 \wedge \bar{x}_3) \vee (\bar{x}_4 \wedge x_5))$.
- Rather formally: a single boolean variable is an atomic boolean formula. A negation of a boolean formula, OR of two boolean formulas, AND of two boolean formulas are boolean formulas.
- For a boolean formula φ , one can evaluate φ on an assignment $\gamma : V(\varphi) \rightarrow \{0, 1\}$, i.e. determine if φ is satisfied (=1) or not (=0) by γ .
- A formula φ is **satisfiable** if there is an assignment γ satisfying φ .

BOOLEAN SATISFIABILITY, SATISFIABILITY IN SHORT

INPUT: a boolean formula φ

QUESTION: is there a satisfying assignment to the variables of φ ?

SATISFIABILITY IS NP-COMPLETE

COOK-LEVIN THEOREM

SATISFIABILITY is NP-complete.

- Let $L \subseteq \{0, 1\}^*$ be an arbitrary language in NP.
- Equivalently, there exist a polynomial $p : \mathbb{N} \rightarrow \mathbb{N}$ and a P-time TM M s.t. for every $x \in \{0, 1\}^n$

$x \in L$ if and only if
there exists $w \in \{0, 1\}^{p(n)}$ for which $M(x, w) = 1$.

- Goal: show $L \leq_p$ SATISFIABILITY.
- How: for every $x \in \{0, 1\}^n$, construct a boolean formula φ_x s.t.
there exists a witness w of length $p(n)$ if and only if
there exists a satisfying assignment to φ_x
in time polynomial in n .

PROOF OF COOK-LEVIN THEOREM

COOK-LEVIN THEOREM

SATISFIABILITY is NP-complete.

- Let $L \subseteq \{0, 1\}^*$ be an arbitrary language in NP.
- Equivalently, there exist a single-tape nondeterministic TM M and a polynomial $p : \mathbb{N} \rightarrow \mathbb{N}$ and s.t. for every $x \in \{0, 1\}^n$
 $x \in L$ if and only if there is an accepting computation history of M on x ,
and M halts on x in $p(n)$ steps.
- Goal: show $L \leq_p$ SATISFIABILITY.
- How: for every $x \in \{0, 1\}^n$, construct a boolean formula φ_x s.t.
 M , upon input string x , admits an accepting computation history of
length $p(n)$
if and only if there exists a satisfying assignment to φ_x .

PROOF OF COOK-LEVIN THEOREM

- For simplicity, assume $p(n) \leq n^k$ for some k .
- NTM N would not move the header beyond the first n^k cells in the tape.
- An accepting computation history can be written in a $n^k \times n^k$ table.

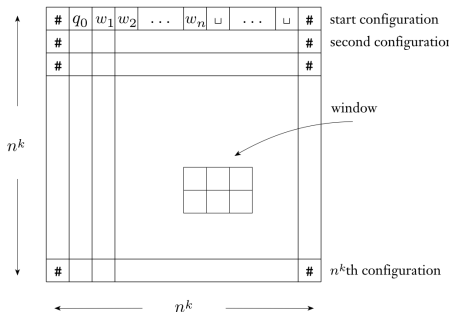

Figure 7.38, Sipser 2012.

PROOF OF COOK-LEVIN THEOREM

Idea similar to the one used for a reduction from A_{TM} to PCP.

$$\varphi_x = \varphi_{cell} \wedge \varphi_{start} \wedge \varphi_{move} \wedge \varphi_{accept}.$$

- Each cell can contain a symbol from $Q \cup \Gamma$ (from N).
- We allocate a variable $z_{i,j,s}$ to each cell (i, j) (row i and column j) and $s \in Q \cup \Gamma$.
- We want to simulate an accepting computation history of M on a length- n input string x by φ_x .
- More specifically, we express the constraints using a boolean formula φ_x so that
 - an accepting computation $n^k \times n^k$ table starting with $q_0 x B B \cdots B$ must satisfy the constraint,
 - any satisfying assignment to φ_x , when written on the cells of the table, forms an accepting computation history.

PROOF OF COOK-LEVIN THEOREM

$$\varphi_x = \varphi_{\text{cell}} \wedge \varphi_{\text{start}} \wedge \varphi_{\text{move}} \wedge \varphi_{\text{accept}}.$$

- φ_{cell} expresses the constraint
"each cell contains a single entry from either Q or Γ "
- φ_{start} expresses the constraint
"the first row is $\#q_0xBB\cdots B\#$."
- φ_{accept} expresses the constraint
"the last row contains $q_{\text{accept}} \in Q$."
- φ_{move} expresses the constraint
"every (i, j) -th 2×3 -window is a part of legit move in δ ."

PROOF OF COOK-LEVIN THEOREM

$$\varphi_x = \varphi_{\text{cell}} \wedge \varphi_{\text{start}} \wedge \varphi_{\text{move}} \wedge \varphi_{\text{accept}}.$$

- φ_{cell} expresses the constraint
“each cell contains a single entry from either Q or Γ ”

$$\varphi_{\text{cell}} = \bigwedge_{\forall(i,j)} \varphi_{i,j,\text{some}} \wedge \varphi_{i,j,\text{atmostone}}$$

where

$$\varphi_{i,j,\text{some}} = \left(\bigvee_{s \in Q \cup \Gamma} z_{i,j,s} \right)$$

and

$$\varphi_{i,j,\text{atmostone}} = \bigwedge_{s,s' \in Q \cup \Gamma, s \neq s'} (\neg z_{i,j,s} \vee \neg z_{i,j,s'})$$

PROOF OF COOK-LEVIN THEOREM

$$\varphi_x = \varphi_{\text{cell}} \wedge \varphi_{\text{start}} \wedge \varphi_{\text{move}} \wedge \varphi_{\text{accept}}.$$

- φ_{start} expresses the constraint
“the first row is $\#q_0xBB\cdots B\#$.”

$$\varphi_{\text{start}} = (z_{1,1,\#}) \wedge (z_{1,2,q_0}) \wedge \bigwedge_{1 \leq i \leq n} (z_{1,i+2,x+i}) \wedge \bigwedge_{n+3 \leq j \leq n^k-1} (z_{1,j,B}) \wedge (z_{1,n^k,\#})$$

PROOF OF COOK-LEVIN THEOREM

$$\varphi_x = \varphi_{\text{cell}} \wedge \varphi_{\text{start}} \wedge \varphi_{\text{move}} \wedge \varphi_{\text{accept}}.$$

- φ_{accept} expresses the constraint
“the last row contains $q_{\text{accept}} \in Q$.”

$$\varphi_{\text{accept}} = \bigvee_{2 \leq j \leq n^k - 1} z_{n^k, j, q_{\text{accept}}}$$

PROOF OF COOK-LEVIN THEOREM

$$\varphi_x = \varphi_{\text{cell}} \wedge \varphi_{\text{start}} \wedge \varphi_{\text{move}} \wedge \varphi_{\text{accept}}.$$

- φ_{move} expresses the constraint
*“every (i, j) -th 2×3 -window is a part of **legal** move in δ .”*
- Legal and illegal moves when $\delta(q_1, a) = \{(q_1, b, R)\}$ and $\delta(q_1, b) = \{(q_2, c, L), (q_2, a, R)\}$.

Figure 7.39, Sipser 2012.

Figure 7.40, Sipser 2012.

PROOF OF COOK-LEVIN THEOREM

$$\varphi_x = \varphi_{\text{cell}} \wedge \varphi_{\text{start}} \wedge \varphi_{\text{move}} \wedge \varphi_{\text{accept}}.$$

- φ_{move} expresses the constraint

“Each (i, j) -th 2×3 -window is a part of **legal** move in δ ”
or equivalently,

$$\varphi_{\text{move}} = \bigwedge_{1 \leq i \leq n^k, 1 \leq j \leq n^k} (i, j)\text{-th window is legal}$$

- Legal windows

#	a	b	q_1	b	c	a	#
#	a	b	c	q_2	c	a	#

PROOF OF COOK-LEVIN THEOREM

$$\varphi_x = \varphi_{\text{cell}} \wedge \varphi_{\text{start}} \wedge \varphi_{\text{move}} \wedge \varphi_{\text{accept}}.$$

- φ_{move} expresses the constraint

$$\varphi_{\text{move}} = \bigwedge_{1 \leq i \leq n^k, 1 \leq j \leq n^k} (i, j)\text{-th window is legal}$$

$$(i, j)\text{-th window is legal} = \bigvee_{\substack{\text{all legal windows} \\ \text{of shape } p}} [(i, j)\text{-th window has shape } p]$$

Each constraint $[(i, j)\text{-th window has shape } p]$ is an ‘AND’ of 6 variables describing a legal shape p .

Note that the number of shapes yielding a legal window is a constant ($\ll (|Q| + |\Gamma|)^6$).

PROOF OF COOK-LEVIN THEOREM

We described a construction of a boolean formula φ_x from an input string $x \in \Sigma^*$ to L .

It remains to prove that this is a polynomial-time transformation from $L \in \text{NP}$ to SATISFIABILITY.

- The construction can be done in polynomial time in $|x|$ (tedious to check).
- (\Rightarrow) If $x \in L$, then consider the $n^k \times n^k$ table displaying an accepting computation history.
- Choose the assignment to $(z_{i,j,s})_{1 \leq i,j \leq n^k, s \in \text{QUI}}$ which encodes this table.
- Easy to see that each of the subformulas φ_{cell} , φ_{start} , φ_{accept} and φ_{move} is satisfied.

PROOF OF COOK-LEVIN THEOREM

(\Leftarrow) Suppose that φ_x is satisfied by an assignment $(\tilde{z}_{i,j,s})_{1 \leq i,j \leq n^k, s \in Q \cup \Gamma}$.

- 1 it encodes a $n^k \times n^k$ table, where each cell contains a single symbol from $Q \cup \Gamma$; imposed by φ_{cell}
- 2 The first row must be $\#q_0xBB \cdots B\#$; imposed by φ_{start} .
- 3 The last row must contain q_{accept} ; imposed by φ_{accept} .

PROOF OF COOK-LEVIN THEOREM

(\Leftarrow) Suppose that φ_x is satisfied by an assignment $(\tilde{z}_{i,j,s})_{1 \leq i,j \leq n^k, s \in Q \cup \Gamma}$.

- 1 it encodes a $n^k \times n^k$ table, where each cell contains a single symbol from $Q \cup \Gamma$; imposed by φ_{cell}
- 2 The first row must be $\#q_0xBB \cdots B\#$; imposed by φ_{start} .
- 3 The last row must contain q_{accept} ; imposed by φ_{accept} .

To see that $C_i \vdash_M C_{i+1}$ for rows C_i and C_{i+1}

- Obs 1: if C_i contains a single symbol from Q , then C_{i+1} contains a single symbol from Q , in a position captured by some 2×3 -window.
- Obs 2: the 2×3 -window with q in the top center must describe a legal move.

CNF-SAT

- **CNF (Conjunctive Normal Form)** formula: \wedge ('AND') of \vee 's ('OR') of variables and their negations.
 $(x_1 \vee \bar{x}_3) \wedge (x_2 \vee x_4) \wedge (\bar{x}_1 \vee x_2 \vee \bar{x}_5) \wedge (\bar{x}_1 \vee \bar{x}_3 \vee \bar{x}_4 \vee x_5).$
- Literals are variables and its negations.
- A clause is a OR's over literals.
- CNF formula is a conjunction ('AND') of clauses.
- A formula φ is kCNF if each clause contains at most k literals.

CNF-SAT

INPUT: a CNF formula φ

QUESTION: is there a satisfying assignment to the variables of φ ?

PROOF OF COOK-LEVIN THEOREM

Instead of (Boolean formula) SATISFIABILITY, we want to reduce L to CNF-SAT.

$$\varphi_x = \varphi_{cell} \wedge \varphi_{start} \wedge \varphi_{move} \wedge \varphi_{accept}.$$

$$\varphi_{cell} = \left(\bigvee_{s \in Q \cup \Gamma} z_{i,j,s} \right) \wedge \bigwedge_{s,s' \in Q \cup \Gamma, s \neq s'} (\neg z_{i,j,s} \vee \neg z_{i,j,s'})$$

$$\varphi_{start} = (z_{1,1,\#}) \wedge (z_{1,2,q_0}) \wedge \bigwedge_{1 \leq i \leq n} (z_{1,i+2,x+i}) \wedge \bigwedge_{n+3 \leq j \leq n^k-1} (z_{1,j,B}) \wedge (z_{1,n^k,\#})$$

$$\varphi_{accept} = \bigvee_{2 \leq j \leq n^k-1} z_{n^k,j,q_{accept}}$$

$$\varphi_{move} = \bigwedge_{1 \leq i \leq n^k, 1 \leq j \leq n^k} \bigvee_{\text{all legal windows of shape } p \text{ centered at } (i,j)} [\text{'AND' of 6 variables describing } p]$$

PROOF OF COOK-LEVIN THEOREM

Instead of (Boolean formula) SATISFIABILITY, we want to reduce L to CNF-SAT.

$$\varphi_x = \varphi_{\text{cell}} \wedge \varphi_{\text{start}} \wedge \varphi_{\text{move}} \wedge \varphi_{\text{accept}}.$$

$$\varphi_{\text{move}} = \bigwedge_{1 \leq i \leq n^k, 1 \leq j \leq n^k} \bigvee_{\substack{\text{all legal windows} \\ \text{of shape } p \\ \text{centered at } (i, j)}} [\text{'AND' of 6 variables describing } p]$$

We want to convert 'OR' of 'AND' (on constant # of variables) to 'AND' of 'OR' (of the same variables) so that an assignment satisfies one if and only if it satisfies the other.

Conversion by example: $(\neg y_1 \wedge y_2 \wedge \neg y_3) \vee (y_1 \wedge \neg y_2 \wedge y_3) \vee (\neg y_1 \wedge y_2 \wedge y_3)$
